Hmmingbird

Hmmingbird is an audio-search engine that searches for the melody of a song, instead of it's lyrics and words.

It taken an Audio input, parses it to obtain a normalized numerical representation of the audio, which is the indexed.

Indexing

Indexing is the process of a **search** engine collecting, parsing and storage of **data** for use by the **search** engine. .

Polyglot Persistence

It is a fancy term to mean that when storing data, it is best to use multiple data storage technologies, chosen based upon the way data is being used by individual applications or components of a single application.

Neo4j

to provide real time personalized product recommendations, and Speed up Search.

MongoDB

Document Data Model for Power Browsing/ Searching for Products.

With the **neo4j_doc_manager** service running, any documents inserted into MongoDB will be converted to a property graph structure and immediately inserted into Neo4j as well. Document keys will be turned into nodes. Nested values on each key will become properties.
